Contents

1 General Introduction 9

Inflammation and vascular remodeling

2 The effect of interleukin-10 knock-out and overexpression on neo-intima formation in hypercholesterolemic APOE*3Leiden mice

3 Anti-MCP-1 gene therapy inhibits vascular smooth muscle cells proliferation and attenuates vein graft thickening both in vitro and in vivo

Pericellular proteases and vascular remodeling

4 *In vivo* suppression of vein graft disease by non-viral, electroporation mediated, gene transfer of TIMP-1-ATF, a cell-surface directed matrix metalloproteinase inhibitor
   *Accepted for publication in J Vasc Surg.*

5 Electroporation mediated gene transfer of a novel urokinase receptor-targeted protease inhibitor for plasmin and matrix metalloproteinases suppresses vein graft disease in murine and human blood vessels
   *Submitted for publication.*

RNA interference

6 Local lentiviral shRNA silencing of CCR2 inhibits vein graft thickening in hypercholesterolemic APOE*3Leiden mice
7 Prolonged in vivo gene silencing by electroporation mediated plasmid delivery of siRNA

8 Summary, conclusions and future perspectives
