Acknowledgments

The appearance of this manuscript is made possible due to a number of people that in every possible way supported me in this sometimes quite arduous but interesting mission. First of all, I would like to express my gratitude to the supervisor of my Ph. D., Prof. Dr. Bernard Nieuwenhuys for inviting me in the Netherlands and giving me the opportunity to work in his group. His constant attention, encouragement and careful guidance have made the appearance of this thesis possible. Starting of an enterprise is a half of success. On my start I owe valuable assistance to Emile Rienks, who introduced me in SPM measurements and who was my first attentive and patient instructor in this fascinating pursuit.

Having arrived in AMOLF institute, I met many dedicated people, whose good attitude and diligence I shall always remember. I am enormously grateful to Dr. Ir. Jan Verhoeven for providing me with excellent working conditions and the opportunity to work on a free schedule. I am thankful Dr. Johan Bakker for his continuous support, advices, help with data processing, constructive comments which made this work successful. I am thankful to all of them for having been very attentive readers of the earlier versions of the manuscript and help with the improving of its language. As well, I shall never forget many discussions which paved the way to the success of the experiments.

I wish to acknowledge many of the AMOLF people, always ready to help. My special and sincere credits go to Hans Zeijlemaker, who constantly helped me with keeping the set-up running. I am indebted the staff of the AMOLF library for providing me rapidly with all necessary papers. As well I am very obliged to the ladies from the reception for the many X’s they put for me in the presence list, every time I arrived at the institute after half past nine in the morning. I kindly thank to Ilja Cerjak, Wim Barsingerhorn for helping me to cope with all necessary construction work. I also wish to acknowledge Wim Brouwer and all the staff of the AMOLF workshop.

At AMOLF, it was a pleasure to share the set-up and the room with my dedicated colleagues M. Alink and Sergiy Dobrovolskiy, as well as I enjoyed very much our cooperation during the experiments. Our discussions about ‘world global politics’ had brought wonderful refreshment in ‘SPM-UHV’ atmosphere.

I am very much pleased to cooperate with the staff at the Department of Chemistry and colleagues in the SURFCAT group: Emile Rienks, Andreea Gluhoi, Mihail Grecea, Kees-Jan Weststrate, Sonia Carabineiro, and Ellen Backus. I would like to say many thanks to all of you and my very best wishes for everything you do in the future.

I address my warmest credits to Erdni Batyrev for his sincere support and whom I am very much indebted for helping me to move in Amsterdam.

Last, but certainly not least, I would like to thank all my family for love, encouragement and support they have given me all the time.
Curriculum Vitae

The author of this thesis was born on January 19th, 1975 in L’viv, Ukraine. After receiving his Bachelor’s degree in Chemical Engineering from L’viv Polytechnic National University in 1996, he pursued his studies at the same university and obtained his Master’s degree in Chemical Engineering in 1998, specializing in technology of synthesis of organic products. Afterwards he started a Ph.D. project under the supervision of Prof. Dr. V. M. Zhyznevskiy and worked in the field of the oxidative dehydrogenation of ethylbenzene to styrene. The results of the research were presented in the thesis entitled: “Oxidative dehydrogenation of ethylbenzene to styrene”. On January 15th, 2003 he received a degree of a Candidate of Technical Sciences on speciality: Technology of Synthesis of Organic Products. From September 2002 to February 2006, he was a Ph.D. student and performed research in the group of Prof. Dr. B. E. Nieuwenhuys at the Leiden Institute of Chemistry, Leiden University, on the subject of model heterogeneous catalysts. The results of the research accomplished in this period have formed the basis for the presented thesis: “A comparative study of platinum nanodeposits on HOPG(0001), MnO(100) and MnO/MnO(100) surfaces by STM and AFM after heat treatment in UHV, O2, CO and H2”. For this project he worked both at the Leiden University (the Netherlands) and the FOM Institute for Atomic and Molecular Physics (AMOLF), Amsterdam (the Netherlands) under the joint supervision of Prof. Dr. B. E. Nieuwenhuys and Dr. Ir. J. Verhoeven.
This thesis is partly based on the following publications:

2. R. D. Tsybukh, J. Verhoeven, J. W. Bakker, B. E. Nieuwenhuys, AFM study of surface topography of a MnO(100) single-crystal after heat treatment in UHV and oxygen. (in preparation).

3. R. D. Tsybukh, J. Verhoeven, J. W. Bakker, B. E. Nieuwenhuys, STM and AFM investigations of platinum deposits on MnO(100) and MnOₓ/MnO(100) surfaces. (in preparation).
