The Early and Middle Pleistocene Archaeological Record of Greece
V. Tournoukis

By applying a fieldwork-based geoaarchaeological approach, Tournoukis examines in this study the evidence from Greece within the framework of the earliest occupation of Europe.

Although the Greek Peninsula lies within a core area of early human movements between Africa and Europe but also within Europe itself, the Lower Palaeolithic record of Greece remains as yet extremely poor. Choosing the scarcer Greek record as a case-study, Tournoukis elaborates on a hitherto largely overlooked subject in the Eurasian Early-Middle Pleistocene archaeology: the role of geomorphic processes in biasing archaeological distribution patterns of early human presence. This study identifies the current status of the record, explains this status from a geoaarchaeological and geomorphological perspective, and prospects its future enrichment. The analysis is carried out on a landscape-scale and it assesses preservation potential in conjunction with archaeological visibility. Finally, a conceptual model emerges that can assist in interpreting and/or predicting early Palaeolithic site locations in tectonically active settings, such as those of the Mediterranean basin.

Archaeological Studies Leiden University (ASLU) is a series of the Faculty of Archaeology, Leiden University since 1999. The series’ aim is to publish Research and PhD theses of Archaeology and covers the international research fields of European Prehistory, Classical, Near Eastern, Indian-American and Science-based Archaeology.
