THE ACCENTUATION OF NEUTER NOUNS IN SLOVENE AND WEST BULGARIAN

Zahodnobolgarska narečja krepijo zanesljivost slovenske razvidnosti za praslavsko kolikost v končnih zlogih. In narobe: slovenska gradiva nudijo podlago za razlago in razvoj naglasnih razredov v zahodnobolgarskih narečjih.

The West Bulgarian dialects corroborate the reliability of the Slovene evidence for Proto-Slavic vowel quantity in final syllables. Conversely, the Slovene material offers a basis for explaining the rise and development of accent classes in West Bulgarian dialects.

The Slovene neo-circumflex is our major source of information for the reconstruction of Proto-Slavic long vowels in posttonic syllables (cf. Kortlandt 1976). As I have pointed out earlier (1975: 27 and 1976: 3f.), trisyllabic word forms which have medial stress as a result of the Proto-Slavic progressive accent shift known as Dybo's law manifest a long reflex of originally acute vowels in final syllables, e.g. osnôva 'base', zabâva 'amusement', nosîla '(she) carried', pîsîla '(she) wrote', telêta 'calves', ţenâmi 'women (inst.)', but gostîla '(she) treated', kovâla '(she) forged', also sedêla '(she) sat', ţelêla '(she) wished', where the stress had never been on the initial syllable. The resulting metatony in the Slovene l-participle was extended by analogy in the dialects, e.g. ţelêla, also mâslîla, vîdêla beside mâslîla '(she) thought', vîdêla '(she) saw' (cf. Rigler 1970 on the geographical distribution of these variants). Thus, we reconstruct a long final vowel in Proto-Slavic *osnôvâ, *zâbâvâ, *nosîlâ, *pîsîlâ, *telêtâ, *ţenâmî, but a short final vowel in *sedêlâ, *ţelêlâ, also *imenâ 'names', *ţenâ 'woman'. The rise of the long vowel must be attributed to an early loss of the acute in post-posttonic syllables, as I have argued earlier (1975: II and passim).

As a result of the development in post-posttonic syllables, the unstressed nom. acc. pl. ending of the neuter consonant stems was always long, e.g. *sêmenâ 'seeds', *plemênâ 'tribes', âgnetâ 'lambs', *telêtâ. This length spread to the unstressed nom. acc. pl. ending of the neuter o-stems, e.g. *lêtâ, Sln. lêtâ, 'years'. I have dated this analogical development to the period before Dybo's law (1975: 32 and 1976: 5). It must have been anterior to the loss of the acute in stressed syllables because it did not affect such forms as drvâ 'firewood', which has original final stress. We may now ask the question: did the length spread to all neuter o-stems with an unstressed nom. acc. pl. ending before Dybo's law? I think that it did, and this is substantially in agreement with Stang's view (1957: 83), but I will return to the question at the end of this article. Thus, I assume analogical lengthening in *selâ, after the Proto-Slavic progressive accent shift *selâ, then retraction of the stress according to Stang's law yielding *sêla with a neo-acute root vowel and a short ending, Sln. sêla 'settlements'. The accentuation of pôlja 'fields', which represents Proto-Slavic end-stressed *pol'â, must have been taken from the
singular, where it is regular after a preposition, e.g. loc. sg. pôlju (cf. Kortlandt 1976: 7). The neo-circumflex eventually spread to such forms as vîna 'wines' (ibidem).

If this is correct, we have to reconstruct the following nom. acc. sg. and pl. forms of disyllabic neuters for the end of the Proto-Slavic period:

(a) *lèto, *lètò, *lètä;
(b) *selò, *selë < *selä;
(c) *pôl’e, *pol’ä.

Neuter consonant stems had unstressed *-ä and stressed *-a in the plural form. The long ending was generalized in Slovak and Babina Greda Posavian, and the short ending in neoštokavian and Omišalj čakavian (Vermeer 1984: 374). Most Posavian dialects tend to have a long ending in all cases except drvà, while Novi čakavian has a short ending in disyllabic neuters and a long ending in consonant stems and in the isolated expression na mestä 'to the fields' (ibidem). The long ending of Slk. mestä 'towns' and Varoš Posavian žitä 'cereals' must go back to the Proto-Slavic period because it provides the model for the analogical extension of the long vowel. Vermeer has pointed out that at least in a part of the Proto-čakavian dialects this analogical extension must have taken place before Stang's law already in order to account for such instances as Novi jaja 'eggs', jelita 'entrails', pola 'fields', Omišalj jaja (1984: 375). These nouns belong to the mobile accent pattern (c), while the distinction between (b) and (c) nouns has been preserved in Omišalj loc. pl. sêlih 'villages' versus jâjih 'eggs' (with loss of the tonal contrast).

We now turn to the Bulgarian evidence. While case forms were lost in this language, the paradigm was enriched by the rise of the definite article. Like other enclitics, the article attracted the stress from barytone forms of nouns belonging to the mobile accent pattern (c), e.g. kosttä 'the bone'. The origin of this accent shift, which is known as Dolobko's law, can be dated to the period before Dybo's law (cf. Kortlandt 1975: 39). Slovene lahkegä, lah kemù 'light (gen., dat.)' show that the stress shifted to the final syllable of the enclitic pronoun. Elsewhere I have argued that the stress was retracted from a short vowel in a final open syllable to a preceding open syllable in early Bulgarian (1982: 93), e.g. vino 'wine', sèlo 'village', rešeto 'sieve', kostite 'the bones', MBulg. vlkatiògo 'of the wolf', as opposed to rebrò 'rib', vlknò 'fiber', mladosttä 'the youth', sin mü 'his son'. As a result of this retraction, the stress falls on the vowel before the article in neutron (c) nouns, e.g. senòto 'the hay', brasnòto 'the flour', polèto 'the field'. This accentuation spread by analogy to the indefinite form in many dialects and in the literary language, e.g. senò, brašnò, polè.

On the basis of all these developments, we can predict the following phonetic reflexes of the Proto-Slavic accent patterns established above:

(a) *lèto, *lètoto, *lèta, *lètata;
(b) *selò, *selòto, *sèla, *selàta;
(b') *rebrò, *rebròto, *rèbra, *rebràta;
(c) *pôl’e, *pol’ä, *pol’ata;
Here we may add end-stressed selò, selâ, rebrâ, polè, pol’â, brašnö under the influence of the definite forms.

We now arrive at the central question of this article: are there traces of the long plural ending *-â in Bulgarian? It goes without saying that there is no direct evidence in (a) nouns because vowel quantity was lost in this linguistic area, but it is possible that the long vowel spread to (c) nouns, as it did in Slovak and Posavian, and if this is actually the case, we expect pattern (c’) instead of (c) because the stress was not retracted from long vowels (cf. Kortlandt 1982: 96). We must therefore examine the distribution of the accent patterns in the separate dialects, in the spirit of Rigler’s work. If the accent patterns of sêlo and polè are kept distinct, as they are in the literary language, we have to reconstruct a long ending in *pol’â for the stage at which the Bulgarian accent retraction took place.

There are several complications which have to be taken into account. First of all, there is a tendency toward generalization of an accentual opposition between singular and plural forms, as in Russian. The opposition in indefinite (b’) and (c’) nouns can easily be extended to the corresponding definite forms. Secondly, the early Bulgarian accent retraction did not reach all dialects, as is clear from the Banat paradigms rakè, rakäta, râce, rauce `(the) hand(s)’, sârci, sârcitö, sârcà, sârcäta `(the) heart(s)’ (Stojkov 1967: 157f.). This is probably a southea- stern feature. Thirdly, the original state of affairs has often been obscured by later retractions, especially in the western dialects. For example, plural forms have generalized retracted stress in the area of Blagoevgrad, giving rise to a paradigm vino, vinöto, vina, vinata `(the) wine(s)’. West Bulgarian and Macedonian texts from the middle ages exhibit essentially the same accentual system as texts of eastern provenance, though the number of variants is larger (cf. Kortlandt 1982: 94). It may therefore be expedient to examine the distribution of accent patterns (c) and (c’) in the West Bulgarian dialects.

Ronelle Alexander has recently studied the relevant material in some detail (1988). She lists nine major accent patterns:

(1) sêto, sêtoto, sêta, sêtata;
(2) vino, vinöto, vina, vinata;
(3) zårno, zårnoto, zårna, zårnata;
(4) krllo, kriloto, krla, krilata;
(5) pêro, pêroto, pêra, pêrata;
(6) vlaknö, vlaknöto, vläkna, vlaknata;
(7) rebrö, rebröto, rebrâ, rebräta;
(8) sëno, senöto, senä, senäta;
(9) licë, licëto, licä, licäta.

On the basis of the considerations set forth above I predict the following reflexes of the Proto-Slavic accent patterns:
— (a) yields (1). If the long plural ending *-â spread to (c) nouns, we expect that analogical introduction of accentual mobility in (a) nouns may lead to a merger with accent pattern (c) rather than (b);
— (b) and (b’) yield (4) and (7). Furthermore, regularization of (7) may yield either (6) or (9);
(c) and (c') yield (4) and (8). Furthermore, regularization of (8) may yield either (5) or (9). If the long plural ending *-ä spread to (c) nouns before the Bulgarian accent retraction, all nouns of this class should belong to pattern (8), and subsequently perhaps to (5) or (9).

I shall now briefly discuss the material of the eight dialects from which Alexander adduces the largest number of examples. It must be noted that *srce will be classified as (c), not (b), cf. Sln. *srca. Like Alexander, I shall treat the dialects anti-clockwise, starting from the southeast.

I. Smoljan: (b) and (c) yield $20 \times (8), 8 \times (5), 3 \times (1)$, and (4) in *uho 'ear', while (a) yields $10 \times (5), 4 \times (8), 2 \times (1)$. It appears that (b) nouns adopted pattern (c), which had a long plural ending *-ä, except in the word *uho, which had the dual ending *-i; (a) nouns adopted accentual mobility at a stage when (b) and (c) nouns were already replacing (8) by (5). The nouns with fixed stress (1) are consonant stems.

II. Sadovo: (c) yields (4) in *uho, *oko, *dårvo, variation between (4) and (8) in *zlato, *more, *nebo, *pole, *vreme, (1) in *ime 'name', further $8 \times (8)$, and (9) in *prase 'pig'; (b) yields $13 \times (8)$, including *mleko, which must be added to Alexander's list, $2 \times (4)$, variation between (4) and (8) in *srebro, (5) in *dano and in *runo, which must be added to Alexander's list, (9) in *tele, (1) in *lice (cf. Georgiev 1907: 433); (a) yields $5 \times (5), 4 \times (8), 1 \times (4), 1 \times$ variation between (4) and (8), $2 \times (1)$. It follows that the short plural ending *-a was preserved in *dvrä and probably in *mor'ä, *pol'ä, *nebesä, *vrčmenä, *imenä, while most other nouns may have had the long ending *-ä; the variation between (4) and (8) in *zlato 'gold' and *srebro 'silver' can easily be due to mutual influence. As in Smoljan, the reflex of pattern (c) was adopted by (b) nouns and later by (a) nouns.

III. Ihtiman: (c) yields (4) in *uho, *oko, *dårvo, $6 \times (8), 2 \times (9)$, further (7) in *červö 'intestine' and (5) in *ime and *vreme; (b) yields (4) in *selo and *plato, (8) in *mleko, *lice, *čelo, *pismo, (7) in *rebro, *vedro, *jajce, variation between (7) and (9) in *vlakno, further $4 \times (9), 1 \times (1)$; (a) yields $3 \times (1), 3 \times (8), 2 \times (5)$. Here we must add *prase (9), *tele (9), *agne (5) and (9), which are missing in Alexander's list (cf. Mladenov 1966: 113). It appears that the short ending *-a was preserved in *dvrä and the long ending generalized elsewhere, while the Bulgarian retraction of the stress is reflected in *selo, *mleko, *lice, *čelo, and its absence in *rebro, *vedro, *jajce, *vlakno, by analogy *červö; (a) nouns adopted the mobile pattern to a lesser extent than in Smoljan and Sadovo. In the dialect of Dobroslavci, which is structurally close to Ihtiman, pattern (b) is reflected as (4) in *perö and $10 \times$ as (8) or (9).

IV. Gorno Pole (near Stanke Dimitrov): (c) yields $8 \times (4), 3 \times (2)$ or (4), further (1) in *zlato, variation between (1) and (3) in *ime, and (9) in *žrebe 'foal'; (b) yields (6) and/or (9) in *gnezdo, *plato, *rebro, *sedlo, *vlakno, *vedro, *jajce, *srebro, *sukno, *deto, *lice, *vinö, *rešeto, (4) in *krilo, *perö, *gumno, *pismo, (2) or (4) in *mleko and *runo, variation between (4) and (6) or (9) in *selo and *čelo, and (1) in *dano; (a) yields $4 \times (1), 3 \times (4), 1 \times (2)$ or (4), $1 \times (3), 2 \times$ variation between (6) and (1) or (4). I conclude that there is no trace of the long plural ending *-ä, while the Bulgarian accent retraction is reflected in *krilo, *perö, *mleko, *runo, *selo, *čelo, *dano, as opposed to *gnezdo, *plato, *rebro, *sedlo, *vlakno, *vedro, *jajce, *srebro, *sukno.
V. Kjustendil: (c) yields (4) in meso, variation between (4) and (8) or (9) in dšrvo and oko, between (7) and (9) in uho, further (3) in ime, (6) in krosno 'beam', (8) in more and vreme, (9) in prase and žrebe; (b) yields (7) in plato, sedlo, (6) in jaje, tele, (4) in dšano, čelo, pismo, further 6 × (2), 1 × (1), 1 × (9); (a) yields 8 × (1), 1 × (2), 1 × (8). This points to a short plural ending *-a in *drvā and *imenā and a long ending *-ā in *prasētā and *žrebētā, while the Bulgarian accent retraction is reflected in dšano, čelo, krilo, pero, selo, as opposed to plato, sedlo, jaje.

VI. Šiškovci (Kjustendilsko Pole): (c) yields (4) in dšrvo, oko, telo, (2) in meso, sorce, perhaps (1) in vreme, (8) in more, nebo, pole, (9) in uho, žrebe; (b) yields 7 × (2) and/or (4), 1 × (1), further (6) in jaje 'egg', (9) in vože 'rope'; (a) yields 7 × (1), 1 × (2), 1 × (5), 2 × variation between (1) and (5), including stado, to be corrected in Aleksander's list (cf. Bojadžieva 1931: 255f). This points to a long plural ending *-ā in *nebesā and *žrebētā and a short ending in most other nouns. The Bulgarian accent retraction was generalized in (b) nouns, except for jajce.

VII. Leško (near Blagoevgrad): (c) yields (4) in oko, (2) in dšrvo, sano, meso, brošno, (1) in ime, more, nebo, vreme, prosa, sorce, (6) in krosno, testo, zlato, prase, uho, žrebe: (b) yields (6) in gnezdo, plato, rebro, sedlo, vlakno, vedro, srebro, sukno, lice, dšano, (2) in selo, vino, (1) in krilo, mleko, čelo, runo, pismo, gumno, (9) in vože; (a) yields 15 × (1) only. This dialect generalized retracted stress in all plural forms except očite 'the eyes'. It suggests a short ending in *drvā, *imenā, *vreme, *nebesā, and a long ending in *prasētā, *žrebētā; the accentuation of krosno and zlato may have been taken from plato and srebro, respectively. It testifies to the Bulgarian accent retraction in selo, vino, krilo, mleko, čelo, runo, and to its absence in gnezdo, plato, rebro, sedlo, vlakno, vedro, srebro, sukno. It displays no analogical mobility of the stress in (a) nouns.

VIII. Goce Delčev: (c) yields (8) in meso, dšrvo, pole, sorce, (5) in zlato, vreme, telo, variation between (1) and (5) in ime; (b) yields 8 × (5), including vino, which is missing in Alexander's list, further (8) in rebro, (1) in tele; (a) yields 7 × (5), but (1) in agne 'lamb'; Alexander mistakenly writes (4) instead of (5) for this dialect (cf. Mirčev 1936: 58f.). This suggests that neuter o-stems had a long plural ending *-a; the Bulgarian accent retraction was apparently generalized in (b) nouns, as in Šiškovci, and eventually (a) and (b) nouns adopted accentual mobility at a stage when (c) nouns already replacing (8) by (5), as in Smoljan. The remaining nouns with fixed stress (1) are consonant stems. There are traces of pattern (4) in ōko, okšto, oči, očite, uši, ušite, which Alexander does not mention.

We may now try to put the evidence together in order to arrive at a tentative reconstruction of the original distribution of the long and short plural endings in West Bulgarian. It appears that all dialects may have had a short ending in *drvā, *imenā, *vreme, and a long ending in *prasētā, *žrebētā, and at least some of the o-stems. The long ending may to a large extent have been generalized in the northern and eastern dialects (I, II, III, VIII), but not in the western dialects (IV, V, VI, VII). There is direct evidence for the Bulgarian accent retraction in the north (III) and the west (IV, V, VI, VII), while mobility was generalized in the Rhodope dialects (I, II, VIII), as was retracted stress in plural forms in the southwest (VII).
Turning back to the other Slavic languages, we see that the Bulgarian evidence for a long plural ending *-ā is in agreement with the material from Slovene and its neighbors. The analogical extension of the long vowel to *prasētā and *žrebētā parallels the transfer of these words from class (c) to class (b) in Slovene (cf. Stang 1957: 93). The preservation of the short ending in *drvā is also found in Slovene and Posavian. The preservation of the short vowel in *imenā, *vremenā and the generalization of the long vowel in *prasētā, *žrebētā are reminiscent of the preservation and generalization of accent pattern (c) in modern Russian imenā, vremenā, plemēnā, semenā, and the generalization of pattern (b) in porosjētā, žerebītā, jagnjētā, cf. teljētā. In the o-stems, the long ending *-ā must have spread to (b) nouns before Stang’s law already because these would otherwise have joined pattern (c) as a result of the early Bulgarian accent retraction, yielding patterns (4), (8), (5), (9), but never giving rise to (7) and (6). After Stang’s law, the long plural ending in the o-stems was limited to accent pattern (a), from where it spread to (c) before the Bulgarian accent retraction because these nouns would otherwise have joined pattern (b), which yielded (4), (7), (6), (9) but did not give rise to (8) and (5). There can be no doubt that the accent retraction affected the West Bulgarian dialects, not only because it is directly reflected in the accentual distribution of the material (see especially dialects IV and VII above), but also because it gave rise to accent pattern (4), which would not otherwise have come into existence. An exception must be made for the dialect of Smoljan (I), where the material is inconclusive.

Thus, the West Bulgarian dialects corroborate the reliability of the Slovene evidence for Proto-Slavic vowel quantity in final syllables. Conversely, the Slovene material offers a basis for explaining the rise and development of accent classes in West Bulgarian dialects.

POVZETEK

Zahodnobolgarska narečja krepijo zanesljivost slovenske razvidnosti za praslovansko kolikost v končnih zlogih. In narobe slovenska gradiva nudijo podlago za razlago in razvoj naglasmih razredov v zahodnobolgarskih narečjih.

Slovenski novi cirkumflex je močan vir obvestilnosti za vzpostavitev praslovanskih dolgih samoglasnikov v ponaglasnih zlogih. Trizložne besedne oblike s sredinskim naglasom kot posledico praslovanskega progresivnega naglasnega premika imajo, kakor se kaže po Dybojevem zakonu, dolgi odraz prvotno akutiranih samoglasnikov v zadnjem zlogu, npr. osnava, zabava, nosila, pisala, telča, ženama proti gostila, kovala, sedela, želela (po analogiji želela ter mislila). Zato za praslovanščino vzpostavljamo *osnova, *zabava itd proti sedela itd. Nastanek dolgega samoglasmaka je posledica zgodnje izgube akuta v poponaglasnih zlogih. To stanje se na svoj način odraža v zahodnih bolgarskih govornih, ki so tu zajeti v 8 skupinah.
