**Author:** Umanski, Daniil  
**Title:** The use of technological support in communication disorders: how development of computer-based tools can refine the treatment of motor speech disorders  
**Date:** 2012-09-18
The path traversing a doctoral research project brings one in contact with many people, whose impact becomes an integral part of the process. Among the many people I have encountered, I first wish to express my gratitude to my supervisor, Professor Niels O. Schiller, who has accompanied my path all the way long, with persistent and patient support for all my activities. The perpetual trust, encouragement and pragmatic support I have received from Niels have been indispensable throughout the steps and choices along the project.

I am enormously grateful for all the children, adults, parents and therapists who have participated in the studies carried out during the research period. The many participants and volunteers have not merely helped to provide the data necessary for applied research, but have granted me some invaluable insights about the needs and the reality of the field of speech-language therapy, as well as remarkably sensitive feedback about the ideas I was investigating.

Furthermore, I wish to thank the various collaborators, with whom I had the chance to work and learn from. A special warm word to Federico Sangati, who has been patient enough to teach me the wonders of Natural Language Processing, and engage in countless discussions, experiments, codings, and laughs. I am very grateful to Caroline Nater-Berkeljon and Alies Herweijer from the Stuttering Center Rijnland who have opened many windows for me into the reality of stuttering treatment, and have assisted me with carrying out research activities.

I thank Wolfram Ziegler, Anja Staiger, and Ingrid Aichert from the EKN lab in Munich for their belief in my skills, and the fruitful collaboration I have enjoyed with them. I am also indebted to Damjana Kogovšek and Martina Ozbič for hosting me at the University of Ljubljana, and supporting my teaching experience there, which has been extremely valuable. A wholehearted regard goes to Nimrod Peleg from the SIPL lab in Haifa, who has shared my enthusiasm for the assistive side of technology, and supported my research endeavors.
Many thanks to my fellow PhD students at the LUCL and the LIBC, for the helpful discussions and feedback. A special kind word for Daan van de Velde, who has helped me a lot with phonetic theory and misbehaving Dutch syllables. I would like to thank all the members of my doctorate committee: Lisa Cheng, Vincent van Heuven, Wolfram Ziegler, Crit Cremers, Yiya Chen, Willemijn Heeren and Anja Lowit for spending the time and effort to read this manuscript, providing me with valuable comments and ideas for future work.

A very special thought to my friends. I am grateful to Yurii Khomski for his deep understanding and support, to Kavita Heijstek for her attentive care and pragmatic advice. I am grateful to Gideon Borensztajn for his critical thinking, provoking discussions, and for his unwavering help with preparing this manuscript and many practical matters. I am grateful to Oshrat Sella for her encouragement, advice, and keen dialogues. Finally, I am immensely thankful to my family, who are the very foundation of all my constructive movement.
