Author: Gupta, Vikas
Title: Multimodality cardiac image analysis for the assessment of coronary artery disease
Issue Date: 2013-09-11
The work described in this thesis would not have been possible without the support of incredibly helpful colleagues and friends from not one but three different organizations viz., LUMC, TU Delft and Erasmus MC.

First and foremost, I would like to thank my two promoters, Prof. Boudewijn Lelieveldt and Prof. Hans Reiber for giving me this opportunity to work at LKEB, which provided an excellent environment conducive to collaborative research. I cannot thank Boudewijn enough for his positive guidance, motivation and enthusiasm throughout my stay at LKEB. It was his persistent help and encouragement that kept me going despite several setbacks. I had fewer interactions with Hans, but I always admired his tireless enthusiasm and his amazing ability to simultaneously keep track of multiple projects both at LKEB and Medis.

I would also like to thank my co-promoters, Emile and Martijn. Emile was often the first one to find the hidden errors in the equations, and in addition to being an excellent supervisor, he – along with Ans – was also a very gracious host. When Martijn took over as my daily supervisor and I became his office mate, it gave me ample opportunities to interact with him more frequently. I am grateful to Martijn for answering my frequent queries and for his much appreciated help with the last few articles.

During my stay at Poortgebouw, I had the pleasure of working with several office mates from KGB group who also became good friends. I would always miss the wonderful time I had with all of you. In particular, I would like to thank: Nora for lending me money for lunches when I did not have a bank account yet, Meng and Martin (Wildeman) for patiently answering all my questions related to daily life in the Netherlands, Hortense for great time in Nice (twice) and Vienna, Jorik for tips on photography, Ece for organizing KGB outings, and Oleh for being helpful in nearly everything from organizing events to discussing complex mathematical problems. Oleh & Ece, I am really glad that both of you agreed to become my paranymphs. Thank you very much! From the other side of the common KGB wall, Artem, Martin (Baiker), Peter, and Ahmed made sure that the separation between two rooms was just a physical artifact and was therefore never to be taken seriously. I am especially grateful to Martin for his tips on stress management and thesis funding, to Artem for never letting the activities in rooms become dull, to Peter for gladly helping me in moving, to Avan for helping me with AAM/ASM and skeleton of this thesis, and Ahmed for our interesting discussions. Fortunately, I am still able to meet most of you at frequent intervals despite moving out of KGB.

I also owe a gratitude to other LKEB members with whom I had the pleasure to interact with over work and personal matters. Thank you, Alexander, Alize, Andrei, Ancong, Baldur, Berend, Charl, Corine, Denis, Els, Francois, Jasper, Jeroen, Jos, Jouke, Leo, Luca, Marius, Michel, Mohammed, Niels, Patrick, Pieter, Qian, Ronald, Shen, Trung, and Walid for your help with myriads of things such as python coding, the minutiae of Dutch language, regular moving, interesting & eclectic lunch discussions, defense related questions, MISP, NFBI, ... the list goes on. I had less opportunities to interact with most of you, but I always enjoyed talking to you during my visits for meetings and other social events. Michéle & Bertie, hartelijk bedankt for making sure that the administrative and IT related tasks were completed as quickly as possible.
Being a part of the multi-institutional Heart-in-3D project, I benefited greatly from the suggestions of all the collaborators who generously offered their ideas for improvements. Rob was always ready to clear my doubts on perfusion imaging and swiftly solved MASS related issues. Wiro’s comments were always insightful, encouraging and precise. Julien’s suggestions on ICA resulted in substantial improvements in our first article. Raoul and Michiel contributed immensely in CT/CCA data collection, sorting and analyses. Linda & Petra were very helpful in SPECT image analysis. Hortense was always very organized and meticulous, which helped a lot in meeting the submission deadlines. Imad was very enthusiastic and without his support we could not have finished the last chapter of this thesis. Frequent discussions with him allowed me to better understand SPECT perfusion imaging and clinical aspects of myocardial ischemia. Special thanks to all the clinicians from both LUMC and Erasmus MC, who diligently created clinical reports and gave their expert feedback.

Although I visited TU Delft only once a week, I got the opportunity to interact with and learn from many colleagues who were working in computer vision (CV) and pattern-recognition field. In particular, I found the discussions during our CV journal club meetings—especially, between Emile, Laurens, David, Marcel and Marco—very stimulating. I must also thank Yan for our brainstorm sessions on Fourier analysis that sparked the idea for one of the ideas described in this thesis. I was fortunate to be in the same office as Carmen, Pavel, Berend, Yunlei, and Gineke with whom I could talk at length about topics ranging from pattern recognition to languages & traveling. I am also grateful to my corridor mates, Cong, Alessandro, Fei Fei, Lu and Gorkem (later, my roommate), who shared their own research experiences with me. CV/PR group was quite fond of reshuffling which brought fun as well as logistics and network related issues. Thanks to Saskia and Robert, those troubles went away very quickly.

I would also like to thank several friends who gave me company after working hours. It was because of you, Zuzana, that I got to know Martin and Brno – both of them turned out to be wonderful hosts. Thank you very much, Rahil, for being such a supportive friend over the last few years. I really enjoyed our visits to Berlin, Vienna–Hallstatt, Texel, and Nice. Vikrant & Deepali, our fantastic trip last year provided much needed relief to cope up with the stress in last few months of PhD work. I would also like to thank Abhijeet, Ankit, Azadeh, Bineet bhaiya, Brian, Björn & Disha, Harshal, Pragnya, Kumar, Karnal, Muni, Parag, Parul, Prashant, Riayas, Vasundhara, and Yan for the delightful conversations that always cheered me up.

Last but not the least, I am grateful to Ben & Mischa for providing me an opportunity to work as a postdoc in Medical Physics group at Erasmus MC. It has been quite an interesting and enriching experience to work in this group. I am especially indebted to Eliana & Robin who patiently answered all my thesis printing and defense related questions. Gracias, Eliana, for your numerous tips on LaTeX & dank u, Robin, for translating the thesis summary into Dutch.

I can now look back and remember with fondness what a great time I had on the way to this point. Amidst all the changes that dotted this PhD trajectory, one thing remained constant - the support of my family and my wife, Shivani. If I have been able to reach this far despite my recurrent doubts about completing this thesis, it is only because of your continuous support and motivation. Thank you very much for always being there for me.

Vikas
Vikas Gupta graduated with a Bachelor of Biomedical Engineering degree from Manipal University in 2005. His graduation project was entitled \textit{Signal time measurements for MR perfusion measurements}. After graduation, he worked for one year as a Systems Engineer on cardiovascular image processing platforms at Siemens (India). In 2006, he moved to Singapore to pursue further studies and obtained masters degree in Bioengineering at Nanyang Technological University (NTU). His masters work was performed in collaboration with Singapore General Hospital and focused on the development of a novel differential evolution based method for noise reduction in biomedical images. From 2008 to 2012, he worked on this PhD thesis at the Division of image Processing (LKEB) in the Department of Radiology at Leiden University Medical Center and in the Computer Vision group at Delft University of Technology, the Netherlands.

He is currently working as a postdoctoral researcher at the Department of Radiation Oncology in Erasmus Medical Center, Rotterdam.
