**Author:** Torren, C.R. van der  
**Title:** Investigating remission and relapse in type 1 diabetes. Immune correlates of clinical outcome in beta-cell replacement therapies  
**Issue Date:** 2017-04-12
ACKNOWLEDGEMENTS

And then, finally, the end of this thesis. At this point I realize again all your essential contributions towards completion of this work, for which I cannot thank you enough. Only few can be mentioned specifically.

Bart, your guidance with catching enthusiasm as well as sharp criticism have made a strong foundation for this thesis.

Martijn, your creative enthusiasm and positive spirit materializing in many visits to HePatho have been of incredible mental support.

Gaby, your lab training and enormous practical support are the skeleton of this work.

Antoinette, Arnaud, Arno, Fleur, Gonnie, Joana, Jos, Josephine, Laura, Marjolein, Menno, Petra, Sandra, Tanja, Yvonne and Ernst-Jan, Jessica and Niels: many thanks for the good memories of working in the group and for all your great input and help.

Thanks to colleagues from the departments of Immunohematology and Blood Transfusion, Pediatrics, Nephrology, Molecular Cell Biology, Rheumatology and Gastroenterology who gave indispensable access to materials and instruments.

A special thanks to the colleagues from the Diabetes Research Center in Brussels and Leuven for their strong collaboration, enthusiasm and support for our work. Thank you Pieter for accepting to be my second promotor; Bart, Danny and Peter for your critical input; and Ursule, DaHae and Evi for our pleasant teamwork.

I wish to thank other international collaborators from the Beta-cell Transplantation consortium, Mark Peakman’s lab in London and contributors from transplant centers around the world. Chiefly Raphael Scharffmann, Philippe Ravassard and Evert Kroon; thank you for allowing us to expose your creations to our immunological hazards.

Many thanks to my colleagues and supervisors from the Pediatrics community in the Netherlands showing continued interest, understanding and support. Special thanks to Annemarie Verrijn Stuart and her colleagues in Utrecht for the collaboration.

My family and friends I thank for the much needed distraction and immaterial support while repeating the question ‘are you done yet’ in many forms; especially my brother, Alexander, who supplied regular gastronomical support while proving at the same time that a deadline for a thesis is possible.

Last, but not least, my love goes to my wife, Roselin, who kept supporting me when our little time together was, again, consumed by this project; and to our daughter Madeleine who inspired the final sprint to completion.
CURRICULUM VITAE

Cornelis Rudolf van der Torren was born on November 26, 1984 in Heerlen. He graduated cum laude from the Coornhert Gymnasium in Gouda in 2003 and started medical training that same year at the Leiden University Medical Center. During his studies he participated in an exchange program with the Karolinska Institutet, Stockholm, Sweden in 2004. In 2007, he chaired the Leiden International Medical Student Conference and visited the bone marrow transplantation unit in the Hospital de Clinicas, Curitiba, Brazil where his interest for pediatrics and transplantation was incited. He entered a student research project on minor Histocompatibility Antigens in bone marrow transplantation with Prof.dr. Els A.J.M. Goulmy. After obtaining his medical degree cum laude in 2010, he started his PhD research on the immunology of clinical islet transplantation with Prof.dr. Bart O. Roep. In 2014, he started a residency in Pediatrics at Reinier de Graaf Gasthuis in Delft, thereafter in 2016 at the VU University Medical Center in Amsterdam and now continuing his specialization in Pediatrics at the Academic Medical Center in Amsterdam. Cornelis lives with his wife Roselin and daughter Madeleine in Oegstgeest.
