SOFT TISSUE TUMOURS

WHO Classification of Soft Tissue Tumours 9

1 Adipocytic tumours 19
   Lipoma 20
   Lipomatosi 23
   Lipomatosi of nerve 24
   Lipoblastoma / Lipoblastomatosis 26
   Angiolipoma 28
   Myolipoma of soft tissue 29
   Chondroid lipoma 30
   Spindle cell lipoma / Pleomorphic lipoma 31
   Hibernoma 33
   Atypical lipomatous tumour / Well differentiated liposarcoma 35
   Dedifferentiated liposarcoma 38
   Myxoid liposarcoma 40
   Pleomorphic liposarcoma 44
   Mixed-type liposarcoma 46

2 Fibroblastic / Myofibroblastic tumours 47
   Nodular fascitis 48
   Proliferative fasciitis and proliferative myositis 50
   Myositis ossificans and fibroosseous pseudotumour of digits 52
   Ischaemic fasciitis 55
   Elastofibroma 56
   Fibrous hamartoma of infancy 58
   Myofibroma / Myofibromatosis 59
   Fibromatosis colli 61
   Juvenile hyaline fibromatosis 63
   Inclusion body fibromatosis 64
   Fibroma of tendon sheath 66
   Desmoplastic fibroblastoma 67
   Mammary-type myofibroblastoma 68
   Calcifying aponeurotic fibroma 69
   Angiomyofibroblastoma 71
   Cellular angiofibroma 73
   Nuchal-type fibroma 75
   Gardner fibroma 76
   Calcifying fibrous tumour 77
   Giant cell angiofibroma 79
   Superficial fibromatoses 81
   Desmoid-type fibromatoses 83
   Lipofibromatosis 85
   Extraperiosteal solitary fibrous tumour and haemangiopericytoma 86
   Inflammatory myofibroblastic tumour 91
   Low grade myofibroblastic sarcoma 94
   Myxoinflammatory fibroblastic sarcoma 96
   Infantile fibrosarcoma 98
   Adult fibrosarcoma 100
   Myxofibrosarcoma 102
   Low grade fibromyxoid sarcoma 104
   Sclerosing epithelioid fibrosarcoma 106

3 So-called fibrohistiocytic tumours 109
   Giant cell tumour of tendon sheath 110
   Diffuse-type giant cell tumour 112
   Deep benign fibrous histiocytoma 114
   Plexiform fibrohistiocytic tumour 116
   Giant cell tumour of soft tissue 118
   Pleomorphic malignant fibrous histiocytoma / Undifferentiated high grade pleomorphic sarcoma 120
   Giant cell malignant fibrous histiocytoma / Undifferentiated pleomorphic sarcoma with giant cells 123
   Inflammatory malignant fibrous histiocytoma / Undifferentiated pleomorphic sarcoma with prominent inflammation 125

4 Smooth muscle tumours 127
   Angioleiomyoma 128
   Leiomyoma of deep soft tissue 130
   Leiomyosarcoma 131

5 Pericytic (perivascular) tumours 135
   Glomus tumours 136
   Myopericytoma 138

6 Skeletal muscle tumours 141
   Rhabdomyoma 142
   Embryonal rhabdomyosarcoma 146
   Alveolar rhabdomyosarcoma 150
   Pleomorphic rhabdomyosarcoma 153

7 Vascular tumours 155
   Haemangiomas 156
   Epithelioid haemangioma 159
   Angiomeratosi 161
   Lymphangiomi 162
   Kaposiform haemangioendothelioma 163
   Retiform haemangioendothelioma 165
   Papillary intralymphatic angioendothelioma 167
   Composite haemangioendothelioma 168
   Kaposi sarcoma 170
   Other intermediate vascular neoplasms 173
   Epithelioid haemangioendothelioma 173
   Angiosarcoma of soft tissue 175
8 Chondro-osseous tumours 179
  Soft tissue chondroma 180
  Extraskeletal osteosarcoma 182

9 Tumours of uncertain differentiation 185
  Intramuscular myxoma 186
  Juxta-articular myxoma 188
  Deep ‘aggressive’ angiomyxoma 189
  Pleomorphic hyalinizing angiectatic tumour of soft parts 191
  Ectopic hamartomatous thymoma 192
  Angiomatoid fibrous histiocytoma 194
  Ossifying fibromyxoid tumour 196
  Mixed tumour / Myoepithelioma / Parachordoma 198
  Synovial sarcoma 200
  Epithelioid sarcoma 205
  Alveolar soft part sarcoma 208
  Clear cell sarcoma of soft tissue 211
  Extraskeletal myxoid chondrosarcoma 213
  Malignant mesenchymoma 215
  Desmoplastic small round cell tumour 216
  Extrarenal rhabdoid tumour 219
  Neoplasms with perivascular epithelioid cell differentiation (PEComas) 221

BONE TUMOURS

WHO Classification of Bone Tumours 225

10 Cartilage tumours 233
  Osteochondroma 234
  Chondromas 237
  Chondroblastoma 241
  Chondromyxoid fibroma 243
  Synovial chondromatosis 246
  Chondrosarcoma 247
  Dedifferentiated chondrosarcoma 252
  Mesenchymal chondrosarcoma 255
  Clear cell chondrosarcoma 257

11 Osteogenic tumours 259
  Osteoid osteoma 260
  Osteoblastoma 262
  Conventional osteosarcoma 264
  Telangiectatic osteosarcoma 271
  Small cell osteosarcoma 273
  Low grade central osteosarcoma 275
  Secondary osteosarcoma 277
  Parosteal osteosarcoma 279
  Periosteal osteosarcoma 282
  High grade surface osteosarcoma 284

12 Fibrogenic tumours 287
  Desmoplastic fibroma of bone 288
  Fibrosarcoma of bone 289

13 Fibrohistiocytic tumours 291
  Benign fibrous histiocytoma of bone 292
  Malignant fibrous histiocytoma of bone 294

14 Ewing sarcoma / Primitive neuroectodermal tumour 297
  Ewing tumour / PNET 298

15 Haematopoietic tumours 301
  Plasma cell myeloma 302
  Malignant lymphoma 306

16 Giant cell tumours 309
  Giant cell tumour 310
  Malignancy in giant cell tumour 313

17 Notochordal tumours 315
  Chordoma 316

18 Vascular tumours 319
  Haemangioma and related lesions 320
  Angiosarcoma 322

19 Myogenic, lipogenic, neural, and epithelial tumours 325
  Leiomyoma of bone 326
  Leiomyosarcoma of bone 327
  Lipoma of bone 328
  Liposarcoma of bone 330
  Schwannoma 331
  Adamantinoma 332
  Metastases involving bone 334

20 Tumours of undefined neoplastic nature 337
  Aneurysmal bone cyst 338
  Simple bone cyst 340
  Fibrous dysplasia 341
  Osteofibrous dysplasia 343
  Langerhans cell histiocytosis 345
  Erdheim-Chester disease 347
  Chest wall hamartoma 348

21 Congenital and inherited syndromes 349
  Familial adenomatous polyposis 352
  Beckwith-Wiedemann syndrome 354
  Enchondromatosis: Ollier disease and Maffucci syndrome 356
  McCune-Albright syndrome 357
  Multiple osteochondromas 360

Osteochondroma

Definition
Osteochondroma is a cartilage capped bony projection arising on the external surface of bone containing a marrow cavity that is continuous with that of the underlying bone.

ICD-O codes
Osteochondroma 9210/0
Osteochondromatosis NOS 9210/1

Synonyms
Osteochondroma: Osteochondromatous exostosis, solitary osteochondroma.

Multiple osteochondromas: Hereditary osteochondromatosis, hereditary deforming osteochondromatosis, hereditary chondrodysplasia, diaphyseal aclasis, metaphyseal aclasis, hereditary multiple exostoses.

Epidemiology
Solitary osteochondroma
Osteochondroma may be the most common bone tumour (988,1875,2155). The reported incidence, 35% of benign and 8% of all bone tumours, probably is an underestimate as the majority are asymptomatic and not clinically apparent (2155). Most reported cases have been in the first 3 decades with no known sex predilection.

Multiple osteochondromas
Approximately 15% of patients (of all osteochondromas) have multiple lesions (2155), with an incidence up to 1:50,000 in some series (1887). The age of patients with multiple lesions is similar to those with solitary osteochondromas and there is also no sex predilection. Inheritance is autosomal dominant.

Sites of involvement
Osteochondromas generally arise in bones preformed by cartilage. The most common site of involvement is the metaphyseal region of distal femur, upper humerus, upper tibia and fibula (2155).

Involvement of flat bones is less common with the ilium and scapula accounting for most of the cases.

Clinical features
Signs and symptoms
Many, if not most lesions, are asymptomatic and found incidentally. In symptomatic cases, the symptoms are often related to the size and location of the lesion. The most common presentation is that of a hard mass of long-standing duration. Some cases present with symptoms related to secondary complications such as mechanical obstruction, nerve impingement, bursa forming over the osteochondroma, pseudoaneurysm of an overlying vessel, infarction of the osteochondroma or fracture of the stalk of the lesion (131,188,470,988,1072,1468,1681,1875,2119,2152,2155). Increasing pain and/or growing mass may be a manifestation of malignant transformation of osteochondromas. It is estimated to be less than 1% in patients with solitary and approximately 1-3% in patients with multiple osteochondromas. Higher incidences, some up to 20% of malignant transformation in multiple osteochondromas have been reported because of case selection and variable criteria used (211,1131,1875,2155,2206).

Imaging
Solitary osteochondromas may be pedunculated or sessile lesions. The characteristic feature is a projection of the cortex in continuity with the underlying bone. Irregular calcification is often seen. Excessive cartilage type flocculent calcification should raise the suspicion of malignant transformation. CT scan or MRI images typically show continuity of the marrow space into the lesion. These modalities may also predict the thickness of the cartilage cap (464,775, 2285). A thick cap raises the suspicion of malignant transformation. Osteochondromas grow away from the site of active growth, most likely due to forces from adjacent tendons and muscles.

Multiple osteochondromas are similar to the solitary ones but are generally associated with remodeling defects of bone. Many are flat and cauliflower shaped.

Aetiology
The aetiology is not known. Based on the resemblance of the cartilage cap to the growth plate, several hypotheses have been offered. These include the possibility of breakage, rotation and aberrant growth of the physeal plate or herniation of the plate in the metaphysis (415,988,1457,1464,1718).
Fig. 10.03 Outer aspect and cut section of osteochondroma of the upper fibula demonstrating the continuity of the cortex and marrow cavity of the osteochondroma with that of the underlying bone.

Macroscopy
An osteochondroma may be sessile or pedunculated. The cortex and medullary cavity extend into the lesion. The cartilage cap is usually thin (and decreases in thickness with age). A thick and irregular cap (greater than 2 cm) may be indicative of malignant transformation.

Histopathology
The lesion has three layers – perichondrium, cartilage and bone. The outer layer is a fibrous perichondrium that is continuous with the periosteum of the underlying bone. Below this is a cartilage cap that is usually less than 2 cm thick (and decreases with age). Within the cartilage cap the superficial chondrocytes are clustered, whereas the ones close to the transition to bone resemble a growth plate. They are organised into chords and undergo endochondral ossification similar to the zone of provisional mineralization. Loss of the architecture of cartilage, wide fibrous bands, myxoid change, increased chondrocyte cellularity, mitotic activity, significant chondrocyte atypia and necrosis are all features that may indicate secondary malignant transformation. Fractures within a stalk may elicit a focal fibroblastic response. Surface chondrosarcomas differ from osteochondromas by the absence of a stalk and the presence of lobular masses of cartilage that permeate and infiltrate the soft-tissues (1366). Parosteal osteosarcoma may have a zone of typical cartilage simulating a "cap". They are, however, radiographically and microscopically different from an osteochondroma. The characteristic fibroblastic proliferation and cytological atypia is not observed in an osteochondroma.

Genetics
It was long debated whether osteochondroma was a developmental disorder or a true neoplasm. Cytogenetic aberrations involving 8q22-24.1, where the EXT1 gene is located, have been found in ten out of 30 sporadic and in 1 out of 13 hereditary osteochondromas (264, 1430). Moreover, DNA flow cytometry of the cartilaginous cap demonstrated aneuploidy (DNA index range 0.88-1.17) in four of 10 osteochondromas (238). LOH detected by microsatellite analysis using DNA isolated from the cartilaginous cap was found almost exclusively at the EXT1 locus in 3 of 8 sporadic and 2 of six hereditary osteochondromas (238). Fluorescence in situ hybridization revealed loss of the 8q24.1 locus in 27 of 34 (79%) osteochondromas (645).
These findings suggest that both sporadic and hereditary osteochondromas are true neoplasms. The EXT genes, involved in hereditary multiple osteochondromas (HMO), are hypothesised to be tumour suppressor genes. Most of the mutations found in HMO patients are predicted to result in a truncated or non-functional protein. Germ-line EXT mutations combined with loss of the remaining wild type allele were demonstrated in three osteochondromas of two HMO patients (238). One sporadic osteochondroma was described to harbour a deletion of one EXT1 gene combined with an inactivating mutation in the other EXT1 gene (168). Although second mutations have been demonstrated in the minority of cases so far, these findings strongly suggest that inactivation of both copies of an EXT gene in a cartilaginous cell of the growth plate is required for osteochondroma formation in both hereditary and sporadic cases. Indeed, diminished levels of the EXT1 and EXT2 proteins (168) and of their putative downstream effectors (IHh/PTHrP and FGF signalling pathway, see chapter 21) (241) were demonstrated in both sporadic and hereditary osteochondroma chondrocytes (168). Moreover, EXT mutations were described to induce cytoskeletal abnormalities (altered actin distribution) in osteochondroma chondrocytes (168, 169, 1237).

Fig. 10.06 Chromosomal band 8q24 rearrangement in sporadic osteochondroma (on the left). LOH at 8q24 in a patient with multiple exostoses is demonstrated by microsatellite analysis (D8S198). SSCP mutation analysis reveals aberrant bands (indicated by arrows) in both normal (N) and osteochondroma (T) DNA. Sequence analysis reveals a constitutional 15 bp deletion. The PCR fragment containing the mutation is run on a denaturing gel, illustrating loss of the wild-type allele (arrow).

**Prognostic factors**

Excision of the osteochondroma is usually curative. Recurrence is seen with incomplete removal, however, multiple recurrences or recurrence in a well excised lesion should raise the suspicion of malignancy.
